

To achieve this, a new repository is required, as the existing Veracode Integration repo is template-driven and dependent on parent Development repos. The new repo must operate independently and dynamically fetch repositories based on the current Veracode application configuration (Total applications are between 140 and 145).

Implementation Approach

- No effort needed from Dev team, and all tasks will be handled by security team.
- Scans may run longer due to executable build pre-requirements.
- High chance of building failures, and skip scans, which may raise audit gaps.
